

March 20, 2026

Dear Mr. Reitz,

As part of your ongoing projects and operational needs, reliable weather data is paramount to enhance your decision-making processes, ensure safety, and optimize resource allocation. Baron Weather is the sole source that provides the required high-quality and specialized weather data required.

This letter confirms that the Baron Threat Net display, notification, and weather data product is a sole source product manufactured, sold, and distributed exclusively by Baron Weather. This product must be purchased directly from Baron Weather at the address below. There are no agents or dealers authorized to represent this product. No other item(s) or weather data product(s) available for purchase provides the same software and proprietary weather data that Baron offers. Specific sole source weather data and capabilities include:

- **Historical Data:** Baron provides access to historical weather data that takes the guesswork out of what happened. Rather than a collection of raw weather data, the backbone of the Baron Threat Net historical archive is the analyzed and interpreted data using Baron's own state-of-the-science methods. The result is accurate rainfall accumulation, hail and damaging wind path detection, roadway impacts, and more that enable you to validate weather's impact on your personnel, infrastructure, and assets.
- **Real-time Monitoring and Alerts:** Baron offers real-time monitoring alerts and notifications utilizing Baron's patented storm analysis algorithms, providing extremely site-specific location and weather threat notifications. Because we perform our own tracking, there is the potential for advanced lead time when compared to public weather sources or vendors who rely on data from such sources. This timely information is invaluable for ensuring the safety of your personnel, infrastructure, and assets.
- **Expertise and Specialization:** Baron collects, analyzes, and interprets weather-related information. Our meteorologists and data scientists produce unique data products that provide in-depth insights and forecasts tailored to your requirements. Baron technology is embedded in the National Weather Service's Doppler radar network; as a result, Baron has expertise in radar product generation, display, and analysis. Products of interest in this purchase are Baron Storm Tracks, Hail detection and tracking, Wind Shear detection with alerting, Hurricane Hunter data with in-flight tracking, weather-based Road Conditions, and the ability to query the weather data for unique data values. This combination of features is unavailable in other free or commercially available offerings.

We are available to provide any additional information or address any questions.
